

Homework 1

☰ Student Name	Muhammed Oğuz
☰ Student Number	1801042634

Problem Understanding and Approach

First of all, I had to understand how can I use system calls and perform actions in C.

I rewatch lecture recordings. In lesson explanations were strictly enough to handle how can system calls used.

I determine that, I will only need to use `read`, `write`, `open` and `close` system calls.

Apart from those system calls, since we are not allowed to use regex expressions, I will use a lot of C library functions and for loops.

File Structure

makefile

I have a makefile that I using same structure for 2 years.

It basically contains variable to `compile`, `extra flags` and `targets`.

```
You, 2 days ago | 1 author (You)
1  CC = gcc
2  CFLAGS =-Wextra -Wall
3  HEADER = replacer.h
4  SRC = main.c replacer.c
5
6  muo: $(SRC) $(HEADER)
7      $(CC) $(SRC) $(CFLAGS) -o hw1
8
9
10 debug: $(SRC) $(HEADER)
11     $(CC) $(SRC) $(CFLAGS) -g -o hw1
12
13 memory:
14     valgrind ./hw1
```

debug: This option will compile program with `-g` flag. It will allows you to debug. For entering debug mode, you have to run your program with `gdb`.

memory: This option will call `valgrind`. But since, We have to provide arguments, It has no effect for this homework. For valgrind, you have to run command without makefile.

`replacer.h`

This file contains functions declarations. All functions has meaningful comments that contains, return value, brief explanation and params.

There is 3 type of function in my implementation.

main functions: Those functions are main functions. Also they will called from `main.c` file.

free functions: Those functions are used for free operations. With those functions, `valgrind` gives perfect result.

helper functions: Those functions are also important as main functions. But they are not called from main.

Also, there is 2 structure and 1 enum type in this file.

ReplacePattern Structure

This structure holds information about send replace pattern. I used this as an array in my program. An array holds all possible pattern.

```
100, 8 days ago | 1 author (100%)
4   typedef struct
5   {
6       char *replace;
7       char *with;
8       int case_sensitive;
9       int match_multiple;
10      char *match_multiple_str;
11      int match_beginning;
12      int match_end;
13      int match_any;
14      char *match_any_str;
15  } ReplacePattern;
16
```

Line Structure

This structure, holds a **string array** and a **integer** to hold a line and line count.

You, 20 hours ago | 1 author (You)

```
typedef struct
{
    char **words;
    int word_count;
} Line;
```

Error Enum Type

This enum type holds all possible errors in my program. Also there is a function called `print_error_type(Error type)`, to show more information about the error.

```
typedef enum
{
    INVALID_MALLOC = -1,
    INVALID_MATCH_MULTIPLE = -2,
    INVALID_MATCH_ANY = -3,
    INVALID_MATCH_BEGINNING = -4,
    INVALID_MATCH_END = -5,
    INVALID_SLASH_COUNT = -6,
    INVALID_WORD_USAGE = -7,
    INVALID_ARGUMENTS = -8,
    INVALID_INITIALIZATION = -9,
    INVALID_CHAR_OCCURRENCE = -10,
    INVALID_REPLACE_PARAMETER = -11,
    INVALID_COMMA_USAGE = -12,
    FILE_OPEN_ERROR = -13,
    FILE_READ_ERROR = -14,
    FILE_WRITE_ERROR = -15,
    WORD_SPLIT_ERROR = -16,
} Error;
```

replacer.c

This file contains implementation of `replacer.h` functions. It follows same order as `replacer.h`.

main.c

This file holds main function to execute all functions.

Test.txt

This text contains example for working with Homework PDF.

Coding Approach

Determine Patterns

First of all, I divide arguments and try to divide parts to meaningful data.

For achieving that, I used my `ReplacePattern` structure.

There is a function called `detect_replace_pattern`. This function detects replace pattern if all pattern are valid. If not, It will return a meaningful error code.

I tested almost every single possible. It works as expected.

Some test cases that I tested and works fine.

- `$` , `^` places are invalid ✓
- `*` appears front ✓
- `/` count does not satisfies the expected ✓
- Given words are not valid (e.g: Not alphabetical) ✓
- `;` Usage. (Next pattern is not send as expected) ✓
- `[` and `]` are not match. ✓

Read and Write Operations

After determining all possible cases, I tested `read` , and `write` operations. I send some parameters and test strings. After achieving expected working mechanism, I those to functions.

Split Read File

I use my `Line` struct to divide meaningful data of read file.

With power of this structure, Implementing replacement operations are way more easy.

Check String Equality

There are a lot of little configuration to handle and check equality.

- Check if pattern has `$` or `^` .
- Check if pattern is incasesensitive.

- Check if pattern has `*`.
- Check if pattern has multiple choice. (`[` and `]`)

Handling Memory

I wrote some free functions and I try to be careful about memory while implementing. Most of the time I handled it. Some places were a bit challenging but I handled.

Running and Outputs

Detecting Patterns

This example is commented in final code.

```
gcc main.c replacer.c -Wextra -Wall -o hw1
> ./hw1 '/^Window[sz]*/Linux/i;/close[dD]$/open/' domates.txt
replace: Window[sz]*
witch: Linux
is exit case sensitive: 1
is exit match multiple: 1
is exit match multiple str: sz
is exit match beginning (^): 1
is exit match end ($): 0
is exit match any (*): 1
is exit match any str: sz
-----
replace: close[dD]
witch: open
is exit case sensitive: 0
is exit match multiple: 1
is exit match multiple str: dD
is exit match beginning (^): 0
is exit match end ($): 1
is exit match any (*): 0
is exit match any str: (null)
```

As shown above, It detects all expected pattern matchings.

Testing Input in Homework PDF

```
./hw1 '/^Window[sz]*/Linux/i;/close[dD]$/open/' test.txt
```

Result

1- Windows	windowz	windOws	1+ Linux	windowz	windOws
2- Windowzzz	will	change	2+ Linux	will	change
3- windowsss	both		3+ Linux	both	
4	replace windows	please	4	replace windows	please
5	please replace	windows	5	please replace	windows
6	now try close	please	6	now try close	please
7	closed or closed	or both	7	closed or closed	or both
8	close will not	change i think	8	close will not	change i think
9- only last one	closed		9+ only last one	open	
10	will	change	10	will	change
11- closeeeed	closed		11+ closeeeed	open	
12- closed			12+ open		

Terminal Output of Successful Run

```
> ./hw1 '/^Window[sz]*/Linux/i;/close[dD]$/open/' domates.txt
Successfully executed desired pattern
```

Invalid Input Result

When user enters wrong argument, It will shows relative error, print manual and exit wit `EXIT_FAILURE`.

```
> ./hw1 '/^Window[sz]*/Linu-x/i;/close[dD]$/open/' domates.txt
INVALID_CHAR_OCCURRENCE
Usage is invalid. See the manual
Usage: ./hw1 "[replace pattern]" inputFilePath
Replace Pattern Examples
Example: "/str1/str2/"          → Replace str2 with str1
Example: "/str1/str2/i"        → Casesensitive
Example: "/str1/str2;/str3/str4/" → Combine mutiple replace patterns
Example: "/[zs]tr1/str2/"      → Multiple character match
Example: "/^str1/str2/"        → Match at the beginning of the line
Example: "/str1$/str2/"        → Match at the end of the line
Example: "/st*r1/str2/"        → Match any number of characters
Also you can combine multiple search patterns
```

Valgrind Result

Normal

```
> valgrind ./hw1 '/^Window[sz]*/Linux/i;/close[dD]$/open/' domates.txt
==22313== Memcheck, a memory error detector
==22313== Copyright (C) 2002-2017, and GNU GPL'd, by Julian Seward et al.
==22313== Using Valgrind-3.15.0 and LibVEX; rerun with -h for copyright info
==22313== Command: ./hw1 /Linux/i;/close[dD]$/open/ domates.txt
==22313==
Successfully executed desired pattern
==22313==
==22313== HEAP SUMMARY:
==22313==     in use at exit: 0 bytes in 0 blocks
==22313==   total heap usage: 124 allocs, 124 frees, 2,250 bytes allocated
==22313==
==22313== All heap blocks were freed -- no leaks are possible
==22313==
==22313== For lists of detected and suppressed errors, rerun with: -s
==22313== ERROR SUMMARY: 0 errors from 0 contexts (suppressed: 0 from 0)
```

With `-leak-check=full` flag

```
> valgrind -leak-check=full ./hw1 '/^Window[sz]*/Linux/i;/close[dD]$/open/' domat
==22317== Memcheck, a memory error detector

```

Missing Parts

I checked almost everything. If I don't missed anything, I have only one failure for this homework.

When using `[abc]*` (using match multiple and match any). It works fine,

But since `*` symbol should behave, none or more occurrence.

If none occurrence were applied, It does not working.

Example: `/str[abc]*/change/` → `straaa`, `strbb`, `strcccc` will be `change`. But `str` will not work unfortunately.

But without combining them, `*` works fine in alone.

Example: `/st*/change/` → `sttr`, `str`, `sr` will be `change`.

I run so many tests and this is the only failure that I found myself.
